

FOR TRANSCRIPT – 1:

EXPLANATION :

The interview conversation most closely matches the **Engineering Student proto-persona (Riya Sharma)** because the participant mainly uses AI for assignments, coding help, and understanding concepts while facing academic pressure and deadlines. The person shows a balanced attitude toward AI by recognizing that AI can support learning but that copying answers without understanding is unethical. They also admit to occasionally submitting AI-generated work for simpler tasks due to time constraints, which reflects dependency on AI for efficiency. At the same time, the participant does not fully trust AI and usually verifies important answers through other resources, showing moderate AI awareness and responsibility. Overall, the conversation suggests that the participant is an efficiency-driven student who values quick solutions and productivity while still understanding the importance of learning, critical thinking, and ethical AI usage.

FOR TRANSCRIPT – 2:

EXPLANATION :

The interview conversation most closely matches the **Senior Software Engineer proto-persona (Arjun Verma)** because the participant uses AI in a more analytical and research-oriented way rather than for simple assignment completion. The participant is highly aware of AI hallucinations, frequently verifies outputs, cross-checks research papers, and understands the importance of critical thinking while using AI. They also use AI mainly for improving productivity, research efficiency, and extracting specific information rather than blindly depending on it, which strongly aligns with the behaviors, goals, and skepticism described in the Senior Software Engineer persona.

FOR TRANSCRIPT – 3:

EXPLANATION :

The interview conversation most closely matches the **Engineering Student proto-persona (Riya Sharma)** because the participant mainly uses AI for studying, understanding difficult topics, summarising notes, and completing assignments while relying on quick explanations for academic tasks. The participant also admits that constant AI usage makes tasks feel harder without AI support and mentions feeling pressure to use AI because everyone else is using it. Additionally, they understand the ethical boundary between learning and cheating, verify important answers, and recognize that overdependence on AI can reduce independent thinking, which strongly aligns with the behaviors, goals, and frustrations described in the Engineering Student persona.

FOR TRANSCRIPT – 4:

EXPLANATION :

The interview conversation most closely matches the **Engineering Student proto-persona (Riya Sharma)** because the participant mainly uses AI for studying, understanding concepts, solving problems, brainstorming ideas, and helping with assignments. The participant shows moderate trust in AI by verifying important answers, especially for exams and assignments, and is aware that AI can

confidently provide incorrect information, particularly in numerical and math-related problems. They also recognize that overreliance on AI can reduce deep thinking and conceptual understanding, while still viewing AI as a useful learning and productivity tool, which strongly aligns with the behaviors and mindset described in the Engineering Student persona.
